Input File Instructions

The files use assembly names for each species:
hg19: human
panTro4: chimpanzee
mm10: mouse
camFam3: dog

I have named the input file as input.txt, so we need to rename the input file in order to use it. Also the hg19Knowngene.txt file should be renamed as knowngene.txt.

Also in the code the promotor length is set to 1000 as default. So need to change that to 100, 200 or whatever value as per requirments.
